Mail Stop Appeal Brief - Patents  
Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

**APPEAL BRIEF UNDER 37 C.F.R. § 41.37**

This is an appeal to the Board of Patent Appeals and Interferences from the decision of the Examiner of Group 2612, dated March 21, 2005, in which claims 1-20 in the above-identified application were finally rejected. This Appeal Brief is hereby submitted pursuant to 37 C.F.R. § 41.37(a).

**I. REAL PARTY IN INTEREST**

The real party in interest is the assignee of the full interest in the invention, Sony Electronics, Inc., 1 Sony Drive, Park Ridge, New Jersey 07656.

## **II. RELATED APPEALS AND INTERFERENCES**

To the best of Appellant's knowledge, there are no appeals or interferences related to the present appeal that will directly affect, be directly affected by, or have a bearing on the Board's decision in the instant appeal.

## **III. STATUS OF THE CLAIMS**

Claims 1-20 are pending in the application and were finally rejected in an Office Action mailed March 21, 2005. Claims 1-20 are the subject of this appeal. A copy of Claims 1-20 as they stand on appeal are set forth in Appendix A.

## **IV. STATUS OF AMENDMENTS**

No amendments to the claims have been made after receipt of the Final Office Action.

## **V. SUMMARY OF CLAIMED SUBJECT MATTER**

Appellant's invention as claimed in claims 1-20 is directed to capturing a raw image and providing edge enhancements to increase edge detail to the capture raw image as part of a demosaicing process [Specification: Page 9, Line 17 – Page 10, Line 10; Figure 3] A brightness map of the captured raw image is used for providing the edge enhancements. [Specification: Page 10, Line 22 – Page 11, Line 20; Figure 5] Furthermore, the edge of the captured raw image is detected using the brightness map, a mask image is created from edge detected brightness map, and an unsharp edge enhancement is performed on the mask image. [Specification: Page 11, Line 21 – Page 12, Line 19; Figure 5]

## **VI. GROUNDS OF REJECTION TO BE REVIEWED ON APPEAL**

I. Claims 1-15 stand rejected under 35 U.S.C. § 103(a) over U.S. Patent No. 6,404,918 to Hel-or et al. in view of Kimmel (IEEE Transactions on Image Processing, Col. 8, No. 9) and U.S. Patent No. 5,717,781 to Ebel, et al.

II. Claims 16-20 stand rejected under 35 U.S.C. § 103(a) over Hel-or et al. in view of Kimmel, Ebel et al., and U.S. Patent No. 6,288,743 to Lathrop et al.

## VII. ARGUMENTS

I. Claims 1-15 are Patentable under 35 U.S.C. § 103(a) over Hel-or et al in view of Kimmel and Ebel et al.

Hel-or discloses a demosaicing method for generating a full color image from a partially sampled image. During the demosaicing process, the luminance image component is directionally smoothed along image edges to preserve edge detail. Thus, Hel-or discloses preserving edge detail during the demosaicing process.

Kimmel discloses reconstructing a digital image by first demosaicing and then enhancing the resulting image. The demosaicing step reconstructs the image using an edge-weighted interpolation, so as to avoid interpolating across edges and preserving edge detail. The enhancement step enhances the edges of the reconstructed image by inverting the color diffusion across the edge.

Ebel discloses analyzing an image of a contact lens to determine quality of contact lens. A CCD sensor captures the image and an image processing system corrects the image for known defects in the CCD sensor. The system enhances the edge detail of the lens in the corrected image using an edge enhancement operator. In addition, the system partitions the image into five zones so that the proper directional edge operator is chosen. The system analyzes the lens quality based on the enhanced, corrected image.

***A. Claims 1, 2, 6, 7, 11, 12***

Claims 1, 2, 6, 7, 11, and 12 stand or fall together. Claim 1 is the representative claim. The invention claimed in claim 1 captures a raw image and performs edge enhancements to increase edge detail on the raw image as part of a demosaicing process.

Appellant respectfully submits that the combination of Hel-or, Kimmel and Ebel does not teach or suggest each and every element of claim 1. In claim 1, Appellant claims providing edge enhancements to increase edge detail of a captured raw image as part of a demosaicing process. The Examiner admits that Hel-or does not teach or suggest this claim limitation and relies on Kimmel and Ebel as disclosing the missing element.

However, because Kimmel discloses providing edge enhancements to the reconstructed image after the demosaicing step, Kimmel cannot be properly interpreted as disclosing increasing edge detail of the raw image as part of a demosaicing process. Furthermore, because Ebel does not disclose a demosaicing process, Ebel cannot teach or suggest an increase to edge detail of the raw image as part of a demosaicing process.

In addition, Appellant respectfully submits that it would not be obvious to combine Hel-or, Kimmel, and Ebel. “A prior art must be considered in its entirety, i.e. as a whole, including portions that would lead away from the claimed invention.” MPEP 2141.02. Hel-or discloses preserving edge detail whereas Kimmel and Ebel disclose enhancing edge detail. Thus, Hel-or actually teaches away from Kimmel and Ebel. Therefore, it would not be obvious to combine Hel-or with Kimmel and Ebel.

Because none of Hel-or, Kimmel, or Ebel teach or suggest providing edge enhancements to increase edge detail of a captured raw image as part of a demosaicing process as claimed in claim 1, the combination cannot be properly interpreted as disclosing this claimed element. Therefore, the combination cannot render obvious Appellant’s invention as claimed in claim 1. Accordingly, Appellant respectfully requests the withdrawal of the rejection of claims 1, 2, 6, 7, 11, and 12 under 35 U.S.C. § 103(a) over the combination.

### ***B. Claims 3, 8, 13***

Claims 3, 8, and 13 stand or fall together. Claim 3 is the representative claim. Claim 3 depends on claim 1 and creates a brightness map of the capture raw image as part of the edge enhancement process of claim 1.

Appellant respectfully submits that the combination of Hel-or, Kimmel, and Ebel does not teach or suggest creating a brightness map of the captured raw image as claimed. The Examiner asserts Hel-or creates a brightness map because Hel-or separates the reconstructed image into luminance and chrominance bands. However, this process of Hel-or operates on the reconstructed image, not the captured raw image as claimed. Furthermore, neither Kimmel nor Ebel teach or suggest creating a brightness map of the captured raw image as claimed.

Because none of Hel-or, Kimmel, or Ebel, teach or suggest this claimed limitation, the combination cannot be properly interpreted as rendering obvious Appellant's claim 3. Accordingly, Appellant respectfully requests the withdrawal of the rejection of claims 3, 8, 13 under 35 U.S.C. § 103(a) over the combination.

***C. Claims 4, 5, 9, 10, 14, 15***

Claims 4, 5, 9, 10, 14 and 15 stand or fall together. Claim 4 is the representative claim. Claim 4 depends from claim 3. Claim 4 further defines the edge enhancement process by detecting the edges of the captured raw image, creating a mask image from the edge detected brightness map, and performing unsharp edge enhancements on the masked image.

In claim 4, Appellant claims creating a mask image from the edge detected brightness map. The Examiner asserts that Ebel discloses this claimed element by creating a mask image through partitioning the image into five zones. However, the disclosure of Ebel cited by the Examiner discloses partitioning the image so that proper directional edge operator is applied, and does not create a mask image as claimed. In addition, there is no other disclosure in Ebel that teaches or suggests creating a mask image as claimed. Furthermore, neither Hel-or nor Kimmel teach or suggest creating a mask image from the edge detected brightness map.

Because none of Hel-or, Kimmel, or Ebel, teach or suggest this claimed limitation, the combination cannot be properly interpreted as rendering obvious Appellant's claim 4. Accordingly, Appellant respectfully requests the withdrawal of the rejection of claims 4, 5, 9, 10, 14 and 15 under 35 U.S.C. § 103(a) over the combination.

**II. Claims 1-15 are Patentable under 35 U.S.C. § 103(a) over Hel-or et al in view of Kimmel, Ebel et al., and Lathrop et al.**

Lathrop discloses an electronic still camera that processes raw captured images into finished files. The raw captured image is initially processed by a demosaicing step to generate a full color image (referred to in Lathrop as a color filter array interpolation). The image is subsequently subjected to edge enhancements before being stored in the camera's nonvolatile memory.

### ***A. Claims 16-20***

Claims 16-20 stand or fall together. Claim 16 is the representative claim. Claim 16 claims providing edge enhancements to increase edge detail of the captured raw image as part of a demosaicing process.

Appellant respectfully submits that the combination of Hel-or, Kimmel, Ebel, and Lathrop does not teach or suggest each and every limitation of Appellant's invention as claimed in claim 16. Lathrop applies edge enhancements to a full color image and not the raw image as claimed. Thus, Lathrop cannot be properly interpreted as disclosing providing edge enhancements to increase edge detail of the captured raw image as part of a demosaicing process as claimed. Therefore, none of Hel-or, Kimmel, Ebel, or Lathrop teach or suggest this element as claimed.

Because the combination cannot be interpreted as disclosing the claimed element, the combination cannot render obvious Appellant's invention as claimed in claim 16. Accordingly, Appellant respectfully requests the withdrawal of the rejection of claims 16-20 under 35 U.S.C. § 103(a) over the combination.

## **VIII. CONCLUSION**

The combination of Hel-or, Kimmel, and Ebel does not teach each and every limitation of Appellant's invention as claimed in claim 1-15. In addition, the combination of Hel-or, Kimmel, Ebel, and Lathrop does not teach each and every limitation of Appellant's invention as claimed in claims 16-20. Accordingly, Appellant respectfully requests the Board reverse the rejections of Claims 1-20 under 35 U.S.C. § § 103(a) and direct the Examiner to enter a Notice of Allowance for Claims 1-20.

### **Fee for Filing a Brief in Support of Appeal**

Enclosed is a check in the amount of \$500.00 to cover the fee for filing a brief in support of an appeal as required under 37 C.F.R. §§ 1.17(c) and 41.37(a).

**Deposit Account Authorization**

Authorization is hereby given to charge our Deposit Account No. 02-2666 for any charges that may be due. Furthermore, if an extension is required, then Appellant hereby requests such extension.

Respectfully submitted,

BLAKELY, SOKOLOFF, TAYLOR  
& ZAFMAN LLP

**APPENDIX A FOR  
APPELLANT'S BRIEF UNDER 37 C.F.R. 41.37(a)**

1. (Previously Presented) An image processing method comprising:  
capturing a raw image; and  
providing edge enhancements to increase edge detail of the captured raw image as  
part of a demosaicing process.
2. (Previously Presented) The method of claim 1, further comprising:  
performing post demosaicing processing on the captured raw image; and  
outputting the processed image.

3. (Previously Presented) The method of claim 1, wherein providing the edge enhancements includes:  
creating a brightness map of the captured raw image.
4. (Previously Presented) The method of claim 3, wherein providing the edge enhancements further includes:  
detecting edges of the captured raw image using the brightness map;  
creating a mask image from the edge detected brightness map; and  
performing unsharp edge enhancement from the masked image.
5. (Original) The method of claim 4, wherein providing the edge enhancements further includes:  
blending multiplicatively the unsharp edge enhanced image with the brightness map.
6. (Previously Presented) An apparatus comprising:  
an image capturing device to capture a raw image; and  
a processor to provide edge enhancements to increase edge detail of the captured raw image as part of a demosaicing process.
7. (Previously Presented) The apparatus of claim 6, wherein the processor is to perform post demosaicing processing on the captured raw image and to output the processed image.
8. (Previously Presented) The apparatus of claim 6, wherein the processor is to create a brightness map of the captured raw image.
9. (Previously Presented) The apparatus of claim 8, wherein the processor is to detect edges of the captured raw image using the brightness map, to create a mask image from the edge detected brightness map, and to perform unsharp edge enhancement from the masked image.

10. (Original) The apparatus of claim 9, wherein the processor is to blend multiplicatively the unsharp edge enhanced image with the brightness map.
11. (Previously Presented) A machine-readable medium that provides instructions, which if executed by a processor, cause the processor to perform the operations comprising:
- capturing a raw image; and
  - providing edge enhancements to increase edge detail of the captured raw image as part of a demosaicing process.
12. (Previously Presented) The machine-readable medium of claim 11, further providing instructions, which if executed by the processor, cause the processor to perform the operations comprising:
- performing post demosaicing processing on the captured raw image; and
  - outputting the processed image.
13. (Previously Presented) The machine-readable medium of claim 11, further providing instructions, which if executed by the processor, cause the processor to perform the operations comprising:
- creating a brightness map of the captured raw image.
14. (Previously Presented) The machine-readable medium of claim 13, further providing instructions, which if executed by the processor, cause the processor to perform the operations comprising:
- detecting edges of the captured raw image using the brightness map;
  - creating a mask image from the edge detected brightness map; and
  - performing unsharp edge enhancement from the masked image.

15. (Original) The machine-readable medium of claim 14, further providing instructions, which if executed by the processor, cause the processor to perform the operations comprising:
- blending multiplicatively the unsharp edge enhanced image with the brightness map.
16. (Previously Presented) An image processing device comprising:
- an image capturing unit to capture a raw image;
  - a memory device to store the captured raw image;
  - an output unit coupled to the memory device; and
- a processor to provide edge enhancements to increase edge detail of the captured raw image in the memory device as part of a demosaicing process and to cause the enhanced image to be output is to the output unit.
17. (Original) The image processing device of claim 16, wherein the image capturing unit includes a charge-couple device (CCD) array, phototransistors, or photodiodes.
18. (Original) The image processing device of claim 16, wherein the output unit is a display device.
19. (Previously Presented) The image processing device of claim 18, wherein the processor is to perform post demosaicing processing on the captured raw image and to cause the image to be output to the display device.
20. (Original) The image processing device of claim 19, wherein the post demosaicing processing is a white balancing processing or a chromatic improvement processing.
